14. Run the following lines of code and explain the error in your own words. Then rewrite the lines of code to run error free:
f = false not f

Answer :

 File "<ipython-input-20-edad7dc45ab7>", line 1
   f = false not f

SyntaxError: invalid syntax

Explanation :
This error is because the boolean value should need to start with Capital letter, and the 'not f' this should need to be in the next line

Correct syntax:
f = False
not f

Output :
True
